In immunology, antigens (Ag) are structures (aka substances) specifically bound by antibodies (Ab) or a cell surface version of Ab ~ B cell antigen receptor (BCR). The term antigen originally described a structural molecule that binds specifically to an antibody only in the form of native antigen. It was expanded later to refer to any molecule or a linear molecular fragment after processing ...

* Bruton's tyrosine kinase . Following proliferation, small pre-B cells (no longer dividing) undergo V-J joining on one L chain chromosome. Once L chain has been successfully synthesized, it is expressed with m chain on the cell membrane and the cell is called an immature B cell. Immature B cells are very sensitive to antigen binding, so if they bind self antigen in the bone marrow they die.
