Best Answer: Well, in the neighborhood of this common point, the tangent line only intersects the graph in one point, while the secant intersects in two. I said "neighborhood" because you could have a tangent line that ends up intersecting the graph at another point down the road (think of a sine graph as an example).

Tangent and Secant. If a secant and a tangent of a circle are drawn from a point outside the circle, then the product of the lengths of the secant and its external segment equals the square of the length of the tangent segment.

The angle formed by the intersection of 2 tangents, 2 secants or 1 tangent and 1 secant outside the circle equals half the difference of the intercepted arcs! Therefore to find this angle (angle K in the examples below), all that you have to do is take the far intercepted arc and near the smaller intercepted arc and then divide that number by two!

When two secants, or a secant and a tangent, are drawn to a circle from the same external point, one of the following two relationships exists. The first is between the products of the lengths of the external portion of the secant and the lengths of the entire secant. The second is between the square of the length of the tangent segment and the external portion of the secant and the length of ...

This is the Tangent-Secant Theorem. Relationship to Tangent Theorems If you move point B around until it overlaps A, the resulting tangent has a length equal to  $PA^2$ . Similarly, if you drag D around the bottom to point C, the tangent has a length of  $PC^2$ . From this theorem

**Intersecting Secant Theorem - Math Open Reference**

A line passing through two points on a circle is called a secant. A line external to a circle, passing through one point on the circle, is a tangent. The Lesson: We show circle O below in figure a. Points A, B, C, and D are on the circle. The segments AP and DP are secants because they intersect the circle in two points. Notice that the arcs ...

The most familiar trigonometric functions are the sine, the cosine, and the tangent. Their reciprocals are respectively the cosecant, the secant, and the cotangent, which are less used in modern mathematics. The oldest definitions of trigonometric functions, related to right-angle triangles, define them only for acute angles.

Secant and tangent theorems can be used to find congruency, similarity, and special length relationships between the two. One important theorem about secants and tangents states that the measure of an angle formed by two secants, a secant and a tangent, or two tangents intersecting in the interior of a circle is equal to one-half the difference ...
