Model building, however, is different from most other areas of statistics with regard to method selection. There are more general approaches and more competing techniques available for model

building than for most other types of problems. There is often more than one statistical tool that can be effectively applied to a given modeling application.

Factor analysis can be only as good as the data allows. In psychology, where researchers often have to rely on less valid and reliable measures such as self-reports, this can be problematic. Interpreting factor analysis is based on using a "heuristic", which is a solution that is "convenient even if not absolutely true".
