Because we are multiplying by a negative number, the inequalities change direction. $6 > x > -3$. And that is the solution! But to be neat it is better to have the smaller number on the left, larger on the right. So let us swap them over (and make sure the inequalities point correctly): $-3 < x < 6$

Is two comma five a solution of this system? And we have a system of inequalities right over here. We have Y is greater than or equal to $2x$ plus 1 and X is greater than 1. In order for two comma five to be a solution of this system, it just has to satisfy both inequalities. So, lets just try it out ...

Thus, $x=8$ is a solution of the inequality. On the other hand, substituting -2 for x yields the false statement $(-2)-2 > 5$. Thus $x = -2$ is NOT a solution of the inequality. Inequalities usually have many solutions. As in the case of solving equations, there are certain manipulations of the inequality which do not change the solutions.

The solutions for inequalities generally involve the same basic rules as equations. There is one exception, which we will soon discover. The first rule, however, is similar to that used in solving equations. If the same quantity is added to each side of an inequality, the results are unequal in the same order. Example 1 If $5 < 8$, then $5 + 2 < 8 + 2$.
