Reflection seismology (or seismic reflection) is a method of exploration geophysics that uses the principles of seismology to estimate the properties of the Earth's subsurface from reflected seismic waves. The method requires a controlled seismic source of energy, such as dynamite or Tovex blast, a specialized air gun or a seismic vibrator, commonly known by the trademark name Vibroseis.

Seismic migration is the process by which seismic events are geometrically re-located in either space or time to the location the event occurred in the subsurface rather than the location that it was recorded at the surface, thereby creating a more accurate image of the subsurface. This process is necessary to overcome the limitations of geophysical methods imposed by areas of complex geology ...

La sismica a riflessione è un metodo di analisi geofisica del sottosuolo che permette di rilevare con alta precisione le caratteristiche e la geometria delle formazioni rocciose sottostanti la superficie terrestre, utilizzando vari tipi di onde sismiche provocate da esplosivi come dinamite o Tovex, speciali cannoni ad aria o appositi apparecchi generatori di vibrazioni.

Evaluation of rock mass deformability is an important but very challenging task in the analysis and design of underground structures in rock. Although various empirical (correlation) methods have been developed for determining the deformation modulus of rock masses, they come in many forms and are scattered in different sources.
