As mentioned in a previous section of Lesson 4, two or more electrical devices in a circuit can be connected by series connections or by parallel connections. When all the devices are connected using parallel connections, the circuit is referred to as a parallel circuit. In a parallel circuit, each device is placed in its own separate branch. The presence of branch lines means that there are ...

Calculations in Series & Parallel Resistor Networks. Components, including resistors in a circuit may be connected together in two ways: IN SERIES, so that the same current flows through all the components but a different potential difference (voltage) can exist across each one.

### **Series and Parallel Resistors - Learn About Electronics**

Most circuits have more than one component, called a resistor that limits the flow of charge in the circuit. A measure of this limit on charge flow is called resistance. The simplest combinations of resistors are the series and parallel connections illustrated in . The total resistance of a combination of resistors depends on both their individual values and how they are connected.
