While the informal optimization approach described above works reasonably well when the problem under consideration and simulation model used are well understood by the analyst, and the number of decision variables and their feasible ranges (i.e., number of alternative solutions) are relatively small, it is unlikely to yield the best possible outcome for the majority of environmental problems.

In computer science, program optimization or software optimization is the process of modifying a software system to make some aspect of it work more efficiently or use fewer resources. In general, a computer program may be optimized so that it executes more rapidly, or to make it capable of operating with less memory storage or other resources, or draw less power.

If you've been doing some 2D modeling, you most likely have run into what I call nuisance cell errors. You see them while your model is running and they can really slow down your simulation as the RAS chugs through iterations to try to come to a solution.

Methodology Optimization problems. In a genetic algorithm, a population of candidate solutions (called individuals, creatures, or phenotypes) to an optimization problem is evolved toward better solutions. Each candidate solution has a set of properties (its chromosomes or genotype) which can be mutated and altered; traditionally, solutions are represented in binary as strings of 0s and 1s, but ...
