Particles intermediate in size between those found in solutions and suspensions can be mixed such that they remain evenly distributed without settling out. These particles range in size from  $10^{-8}$  to  $10^{-6}$  m in size and are termed colloidal particles or colloids. The mixture they form is called a colloidal dispersion.

Neither colloids nor suspensions are classified as solutions, but are special types of heterogeneous mixtures instead. In order to be a solution, a mixture must have very small particles evenly distributed, so that the mixture has the same properties throughout. Colloids and suspensions have particles that are too big to be considered a solution.

Solutions, Colloids, and Suspensions Pre-Lab Study Questions 1. In making pickles, a cucumber is placed in a strong salt solution. Explain what happens. The water molecules from the higher concentration move down to the area with a lower concentration. The cucumber's water molecules move out which causes the pickling. 2.

**Solutions, colloids, and suspensions - Solutions Colloids ...**

A colloid is intermediate between a solution and a suspension. While a suspension will separate out a colloid will not. Colloids can be distinguished from solutions using the Tyndall effect. Light passing through a colloidal dispersion, such as smoky or foggy air, will be reflected by the larger particles and the light beam will be visible.
