Examples. 1. The solution set of the single equation  $=$  is the set  $\{0\}$ .. 2. For any non-zero polynomial over the complex numbers in one variable, the solution set is made up of finitely many points.. 3. However, for a complex polynomial in more than one variable the solution set has no isolated points.

In mathematics, to solve an equation is to find its solutions, which are the values (numbers, functions, sets, etc.) that fulfill the condition stated by the equation, consisting generally of two expressions related by an equality sign. When seeking a solution, one or more free variables are designated as unknowns. A solution is an assignment of expressions to the unknown variables that makes ...

In other words, it is where the two graphs intersect, what they have in common. So if an ordered pair is a solution to one equation, but not the other, then it is NOT a solution to the system.

Did You Know? A solution is a homogeneous mixture of two substances—that is, it has the same distribution of particles throughout. Technically speaking, a solution consists of a mixture of one or more solutes dissolved in a solvent. The particles of solute and solvent are molecules or ions, with one or more solvent molecules bound to each solute particle.

We have methods for solving equations such as  $.$  But what happens if we have an equation where the variable is in the exponent. If  $.$ , we cannot divide by 3 or subtract 3 from both sides of the equation to solve for  $x$ . Or if the equation is  $.$  we still have a problem isolating the variable. We need a process for solving exponential equations.

Parametric equations are a set of equations that express a set of quantities as explicit functions of a number of independent variables, known as "parameters." For example, while the equation of a circle in Cartesian coordinates can be given by  $r^2 = x^2 + y^2$ , one set of parametric equations for the circle are given by  $x = r \cos(t)$   $y = r \sin(t)$ , (2) illustrated above.
