### **Solution Algorithm**

Algorithm design refers to a method or mathematical process for problem-solving and engineering algorithms. The design of algorithms is part of many solution theories of operation research, such as dynamic programming and divide-and-conquer.

Have fun with your algorithms. 1:2-2 Insertion sort beats merge sort when  $8n^2 < 64n \lg n$ ,  $n < 8 \lg n$ ,  $2n=8 < n$ . This is true for  $2 \leq n \leq 43$  (found by using a calculator). Rewrite merge sort to use insertion sort for input of size 43 or less in order to improve the running time.

It's rarely useful if an algorithm returns the largest number 99% of the time, but 1% of the time the algorithm fails and returns the smallest number instead. [1] If an algorithm imposes a requirement on its inputs (called a precondition), that requirement must be met.

Optimal solutions for Rubik's Cube refer to solutions that are the shortest. There are two common ways to measure the length of a solution. The first is to count the number of quarter turns. The second is to count the number of outer-layer twists, called "face turns".

We could modify the Merge Sort algorithm to count the number of inversions in the array. The key point is that if we find  $L[i] > R[j]$ , then each element of  $L[i:]$  (represent the subarray from  $L[i]$ ) would be as an inversion with  $R[j]$ , since array  $L$  is sorted. COUNTING-INVERSIONS and INTER-INVERSIONS shows the pseudo-code of this algorithm.
